Part 4 Predator and threat Bekantan is endangered

- Monita:** Did you know that Bekantans are endangered?
- Andre:** Oh, no! Why? But, the book says Bekantans can live up to 20 years in the wild. So, what makes them endangered?
- Monita:** Well, many predators, such as crocodiles, leopards, monitor lizards and pythons, eat Bekantans. But, the major threat is habitat destruction.
- Andre:** It means they lose their home--their mangrove trees.
- Monita:** Sadly, human activities make their home disappear.
- Andre:** To save Bekantans we have to save the mangroves!
- Monita:** I agree with you! So, what animals are you going to talk about in our Science project next week?
